GUIDANCE NOTES FOR CONVENTIONALLY BUILT MOTORHOMES

Moisture levels between 0 -15% - no cause for concern.

Moisture levels between 15 - 20% - require further investigation. Compare with the motorhome average readings and consider a recheck after three months.

Moisture levels between 20%-30% - will require further investigations to look for other possible indications of water ingress.

Moisture levels 30% & above -may indicate structural damage or deterioration is occurring. Possible resealing required to avoid further degrading followed by immediate rectification action, as necessary.

GUIDANCE NOTES FOR ALU-TECH CONSTRUCTION MOTORHOMES

Readings are taken on the floor only - readings below 20% are considered acceptable.

Readings greater than 20% will identify areas needing further investigation and possibly remedial work.

PLEASE NOTE

The figures above are given for your guidance only.

If we believe there is cause for concern, we will ensure you are aware of that when we discuss the damp readings with you and will advise you accordingly.

We would emphasise that this report accurately reflects the condition of your motorhome at the date stated. Only the inside of the habitation unit is tested.

These readings may be subject to atmospheric conditions, and the company cannot accept any liability for water ingress, which may become apparent at a future date.

Completed in line with the latest AWS Damp Testing Matrix and carried out in accordance with the latest AWS service technician's handbook and manufacturers guidance in relation to areas required to test.
